“Powering Down and Moving On? Energy Transition, Gentrification, and Local Impacts ”

[\[Most Recent Version\]](#)

Abstract: As the United States navigates a significant energy transition, marked by the retirement of fossil-fuel power plants and a shift towards renewables, it is crucial to comprehend its impact on local communities. This study leverages comprehensive datasets, including USPS Change of Address data and power plant retirement details, to conduct a nationwide assessment of how the retirement of fossil fuel power plants influences local migration trends and community dynamics during an unprecedented energy transition. Contrary to the typical narrative of gentrification, my findings reveal that the complete retirement of fossil-fuel generators in a region leads to a stagnation effect, characterized by decreases in both in-migration and out-migration. Despite improvements in environmental quality, plant closure is associated with long-term declines in employment and wages and a modest decrease in housing values. My analysis further reveals that lower-income groups and regions with a higher proportion of Black residents experience an intensified stagnation effect, raising environmental justice concerns. These findings underscore the complex interplay between the advantages and challenges associated with phasing out fossil fuel infrastructure, emphasizing the need for policies to support at-risk communities during the energy transition.
